

Technical assessment

We invite you to complete the following technical exercise. A production ready solution is not expected; an effort equivalent to approximately two hours should be sufficient. We encourage you to focus on areas where you have the greatest expertise and can demonstrate depth rather than breadth.

Guidance

The use of any tools, including AI-based assistance, is permitted; however, all design and implementation decisions will be considered your own. Please clearly note any known limitations or tradeoffs in your solution.

Technical Exercise

Please design and implement a simulated Car Rental system using object-oriented principles.

Requirements:

- ✓ The system should allow reservation of a car of a given type at a desired date and time for a given number of days.
- ✓ There are 3 types of cars (Sedan, SUV and van).
- ✓ The number of cars of each type is limited.
- ✓ Use unit tests to prove the system satisfies the requirements.

Interview

During the interview, you will be asked to show your code and explain your technical decisions and reasoning. Please concentrate on non-trivial aspects and avoid spending time on boilerplate or purely infrastructural elements. Emphasize the strengths of your solution and the areas where you intentionally chose to invest more effort.
